

ENVIRONMENTAL POLICY

At Adecoagro, we believe that it is possible to conduct our activities while integrating environmental management into our business strategy. Since inception, our aim has been to produce food and renewable energy based on a sustainable production model. Therefore, we have always monitored closely both the environmental aspects and impacts of our activities, and understood the relationship and synergies between production and nature, constantly seeking a balance between the two of them.

Consequently, our management model includes the implementation of an environmental management system tailored for each of our sites. We state our commitment to:

- Complying with legal environmental requirements and other requirements undertaken by our organization, in all our operations and processes.
- Focusing on the continuous improvement of the above-mentioned environmental management system, with the aim of achieving an effective improvement of our environmental performance.
- Protecting the environment and raising awareness within our team, our value chain and other stakeholders.
- Maintaining an open communication channel with our stakeholders and share updates on environmental performance results and other related issues.
- Preventing air, water and soil pollution, as well as promoting a conscious and rational use of all natural resources.
- Protecting the land through good agricultural practices.
- Minimizing the generation of waste and effluents in our processes, by implementing adequate management in each business and operation.
- Promoting a circular economy model in all our processes, seeking to transform waste into inputs and recycling by-products efficiently to create greater value.
- Maximizing the generation of renewable energy from by-products and residues, such as sugarcane biomass, vinasse, animal manure, or other by-products from our operations.
- Contributing to mitigate climate change by measuring our carbon emissions and implementing measures to reduce them.
- Protecting the natural areas of our farms and preserving biodiversity.
- Continuously monitoring the performance of our environmental management system, both in an integrated manner, as well as for each of our businesses.
- Frequently reporting on our environmental performance.

We are convinced that these guidelines contribute to our purpose of producing food and renewable energy for the world based on a sustainable model, thus contemplating the conservation of ecosystems and contributing to the sustainable growth of the communities where we operate.
